Library to send e-mails over different transports and protocols (like SMTP) using immutable messages and streams.  
Also includes SMTP server.

# CHAPTER 1

---

## Why another Mail library for PHP?

---

While analyzing what mail library to use when refactoring a code base, we discovered that the available ones are mostly legacy libraries. Some do not use namespaces and every library we encountered was merely a collection of scalar property bags than objects using encapsulation. Although we used these libs with joy in the past, they do not meet current quality standards. So, we built a new and better library according to modern programming principles.

Use this if you want to send e-mails over different transports and protocols using immutable messages and streams.

### 1.1 Getting started

#### 1.1.1 Installation

Install the library using composer. Execute the following command in your command line (in the project root).

```
$ composer require genkgo/mail
```

#### 1.1.2 Message Instantiation

Use the formatted message factory to create a message

```
$message = (new MessageBodyCollection())
    ->withHtml('<html><body><p>Hello World</p></body></html>')
    ->withAttachment(new FileAttachment('/order1.pdf', new ContentType('application/
↪pdf')))
    ->createMessage()
    ->withHeader(new Subject('Hello World'))
    ->withHeader(From::fromEmailAddress('from@example.com'))
    ->withHeader(To::fromSingleRecipient('to@example.com', 'name'))
    ->withHeader(Cc::fromSingleRecipient('cc@example.com', 'name'));
```

### 1.1.3 Send messages via SMTP

To send the message use a transport, e.g. the SMTP transport.

```
$transport = new SmtpTransport(
    ClientFactory::fromString('smtp://user:pass@host/')->newClient(),
    EnvelopeFactory::useExtractedHeader()
);

$transport->send($message);
```

## 1.2 Send messages via SMTP

```
$transport = new SmtpTransport(
    ClientFactory::fromString('smtp://user:pass@host/')->newClient(),
    EnvelopeFactory::useExtractedHeader()
);

$transport->send($message);
```

## 1.3 PHP mail function

Help wanted.

## 1.4 Send messages via IMAP

```
$transport = new ImapTransport(
    ClientFactory::fromString('imap://user:pass@host/')->newClient(),
    new MailboxName('INBOX')
);

$transport->send($message);
```

## 1.5 File

Help wanted.

## 1.6 Other

Help wanted.

## 1.7 IMAP Protocol

Help wanted.

## 1.8 SMTP Protocol

Help wanted.

## 1.9 Sign messages with DKIM

Help wanted.

## 1.10 Queue Message

Help wanted.
